

# BUSINESS OBJECTS AND NOETIX

Operational Reporting for Oracle E-Business Suite and PeopleSoft Enterprise customers

## Solution Highlights

- Provide simplified data access to Oracle E-Business Suite
- Automatically generate a configuration-specific set of BusinessObjects universes
- Protect investment in custom reports built against the Oracle E-Business Suite database

## NoetixViews

- Simplifies access to data
- Provides configuration-specific content automatically
- Provides upgrade protection
- Self-documenting

## DYNAMICALLY GENERATED BUSINESSOBJECTS UNIVERSES FOR ORACLE AND PEOPLESOFT APPLICATIONS

### Combined solution delivers superior BI for Oracle customers

Enterprise applications have thousands of tables and are too complex to expose directly to end users. Data warehouse solutions don't contain all the data from the operational systems at the lowest level of detail and are only refreshed periodically. The Noetix solution automatically creates BusinessObjects universes for Oracle E-Business Suite (EBS) and PeopleSoft Enterprise applications, enabling users to directly access their transactional data for real-time operational reporting and ad hoc query. The Noetix solution consists of two components: NoetixViews and Noetix Generator for Business Objects.

## NOETIXVIEWS

### Simplified view of data

Noetix's flagship product, NoetixViews, is the cornerstone of the solution. Noetix released the first version of NoetixViews in 1994. Today, more than 1,400 Oracle customers use NoetixViews to simplify data access and reduce the time required to implement reporting solutions for the Oracle E-Business Suite applications.

### Key NoetixViews Features

- **Simplifies access to data.** Noetix deciphers the maze of database tables, joins them properly, and performs the necessary data transformations while also introducing business terminology.
- **Automatically picks up customer-specific application setups.** At the time of installation, Noetix analyzes the application database, deciphers its unique configurations, such as key and descriptive flexfields, and then automatically creates a customized set of NoetixViews.
- **Protects custom reports and queries from application upgrades.** Reports developed directly against the database tables risk expensive rework when the underlying applications are upgraded. Noetix protects reports from these database changes by automatically remapping the views to the new database structures.
- **Documentation provides standardized data definitions and empowers end users.** NoetixViews constructs and publishes a Help File, which documents the customer's unique set of views in their business terminology, making it quick and easy to create operational reports and ad hoc queries.
- **Available for a broad array of Oracle EBS modules,** including: General Ledger, Payables, Receivables, Assets, Procurement, HR, Payroll, Advanced Benefits, Order Management, Inventory, Master Scheduling/MRP, Cost Management, WIP, Cost Management, Bill of Materials, Process Manufacturing, Project Costing, Project Billing, Grants Accounting, Grants Proposal, TeleService, Install Base, Depot Repair, Field Service, and Enterprise Asset Management.

- **New Support for PeopleSoft Enterprise HR**, including: Workforce Administration, Base Benefits, Base Compensation, and Labor Administration. Additional support for Advanced Benefits and Payroll is planned for the second half of 2008.

#### Noetix Generator

- Automates manual administrator tasks
- Generates NoetixViews into universes
- Exports Noetix-generated universes into Business Objects environment

## NOETIX GENERATOR FOR BUSINESS OBJECTS

### Automatic population of BusinessObjects universes

The Noetix Generator for Business Objects further simplifies and accelerates rolling out end user reporting to Business Objects users by automatically populating BusinessObjects universes with NoetixViews, and then publishes the generated universes into the Business Objects environment. As a result, business users can immediately begin using Web Intelligence to develop reports and queries against their Oracle E-Business Suite and Peoplesoft Enterprise applications.

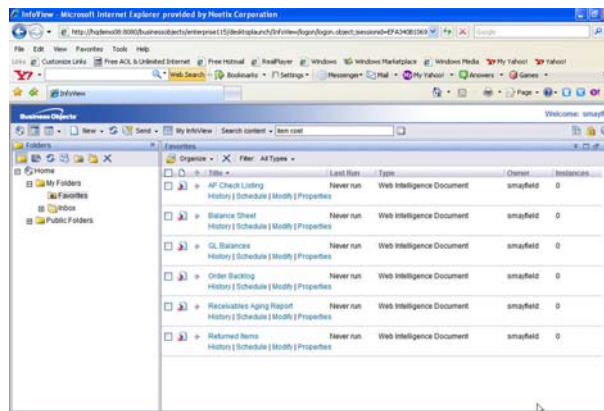

### Key Features for Administrators

Noetix Generator for Business Objects was designed with the Business Objects administrator in mind. The key benefit for administrators is automation, including:

#### Tangible ROI:

- Eliminate costly, time-consuming and risky custom development
- Reduce IT cost by empowering end users to build their own reports
- Eliminate ongoing maintenance and rework of custom developed solutions caused by application upgrades and database schema changes

- Automatic creation of BusinessObjects classes and objects into NoetixViews-based universes
- Automatic population of NoetixViews into Business Objects environment
- Automatic creation of security groups to simplify user management

### Key Features for Business Users

Business Objects users also benefit from the power of Noetix Generator:

- Descriptive content from the NoetixViews Help File is automatically populated into Web Intelligence
- Generated BusinessObjects classes are intuitively organized for easy navigation
- Joins between related Noetix views are predefined, enabling cross-functional reporting

### Summary

Noetix delivers automated access to Oracle EBS and PeopleSoft Enterprise application data through Business Objects platform, making it faster and easier to roll out end user reporting. The combined BusinessObjects-Noetix solution provides superior BI for Oracle.
